CUSTOMERS ANALYTICS

EXECUTIVE SUMMARY | Management brief based on the 7-page Power BI report

64,000	578	15%	$67K	1.25%
Total customers	Buyers	Visit rate	Campaign revenue	Treatment conversion

Executive takeaway

The report describes a large customer base but a very small buyer share: 578 buyers among 64,000 customers (about 0.9%, displayed as 1%). Campaign engagement is also limited: the overall visit rate is 15%, while the reported conversion rate is 1%. The clearest positive signal is the A/B comparison, where the treatment group converts at 1.25% versus 0.57% for control.

Five key findings

1. Low purchase penetration. Only 578 of 64,000 customers are buyers; 63,422 are non-buyers. The immediate growth opportunity is converting existing non-buyers.

2. Champions are the strongest value segment. Champions account for 20,687 customers and approximately $29K in spend, the largest segment contribution. Their average History is 451, compared with 71–75 for Hibernating and Potential Loyalists.

3. A sizeable inactive / at-risk base needs reactivation. At Risk and Hibernating together represent 27,415 customers (about 42.8% of the base). Their average Recency is 9.25 and 9.44 respectively, versus 2.88 for Champions.

4. Mens E-Mail leads the campaign comparison on engagement and value. It has the highest visit rate (18%), average spend ($1.4) and revenue ($30K), compared with Womens E-Mail (15%, $1.1, $23K) and No E-Mail (11%, $0.7, $14K).

5. Channel results differ by objective. Web generates the highest revenue ($31K; 45.95%), while Multichannel is identified as the best conversion channel and has the highest average spend ($1.4). Phone has the lowest visit rate (13%).

ACTION PLAN & CAMPAIGN CONCLUSION

Practical actions linked to the dashboard evidence

Five actionable business recommendations

1. Prioritize Mens E-Mail, then validate before scaling. Allocate the next campaign test to the Mens E-Mail approach because it leads on visits (18%), average spend ($1.4) and revenue ($30K). Scale in controlled batches and monitor conversion and revenue per recipient.

2. Run a reactivation campaign for At Risk and Hibernating customers. Target the combined 27.4K customers with high Recency (9.25–9.44) using a win-back message or limited-time incentive. Measure reactivation rate, conversion rate and incremental revenue against a holdout group.

3. Build a retention / loyalty program for Champions. Protect the 20.7K Champions segment, which contributes about $29K and has the highest average History (451). Test loyalty benefits, early access or repeat-purchase incentives; track retention and spend per customer.

4. Improve the conversion journey for non-buyers. Since 63.4K customers are non-buyers and overall conversion is shown as 1%, identify drop-off points after visits and test clearer calls to action, product recommendations and checkout improvements. Track buyer count and conversion rate.

5. Use channels according to their demonstrated strengths. Use Web as the primary revenue channel ($31K; 45.95%), while testing Multichannel journeys for higher conversion / average spend. Investigate Phone's lower visit rate (13%) and test targeted follow-up to improve engagement.

A/B test: the strongest evidence for campaign optimization

The Business Insights page reports a control conversion rate of 0.57% and a treatment conversion rate of 1.25%. This is an absolute lift of 0.68 percentage points and a relative lift of 119%. The displayed confidence interval for the lift runs from 0.50% to 0.86%, remaining above zero. The treatment also shows $1.42 incremental spend per customer versus $0.65 for control (difference: $0.77). These results support further rollout testing, while monitoring performance by audience and campaign cost.

A/B test conversion rate

Final conclusion on Campaign

Campaign performance is mixed but actionable. Mens E-Mail is the strongest of the three campaign groups on visit rate, average spend and total revenue. More importantly, the A/B test indicates a materially higher conversion rate for treatment than control, with the reported confidence interval fully above zero. The recommended decision is to continue with a measured, phased expansion of the better-performing email treatment—not an unrestricted rollout—while testing costs, audience differences and sustained results. The overall 1% conversion rate and large non-buyer population show that substantial improvement is still possible.

Notes: Values are transcribed from the supplied Power BI PDF. Segment revenue and campaign revenue are shown in rounded thousands; conversion rates are displayed as rounded values in the report. The A/B interpretation uses the report's displayed control/treatment rates and confidence interval. Confirm campaign spend, sample sizes and test allocation before making budget decisions.
